CSE12 - Lecture 25 - A00

Monday, November 28, 2022 8:00 AM

PA6 Late/Resubmit → due tomorrow
PA7/PA8 Late/Resubmit → due Friday
Final Exam → Saturday 8am
Wed Lecture → Extra Credit → takes the quiz at start of class

Composition over Inheritance

Design Patterns
https://en.wikipedia.org/wiki/Design_Patterns
https://en.wikipedia.org/wiki/Software_design_pattern

Familiar Design Patterns

Iterator - Provide a way to access the elements of an object sequentially without exposing its underlying representation.

Adapter (Wrapper) Pattern - Convert the interface of a class into another interface clients expect.

Queue/Stack → used ArrayList

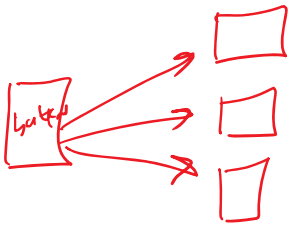
Object Pool - Avoid expensive acquisition and release of resources by recycling objects that are no longer in use.

Factory Method - create objects by calling a factory method rather than by calling a constructor.

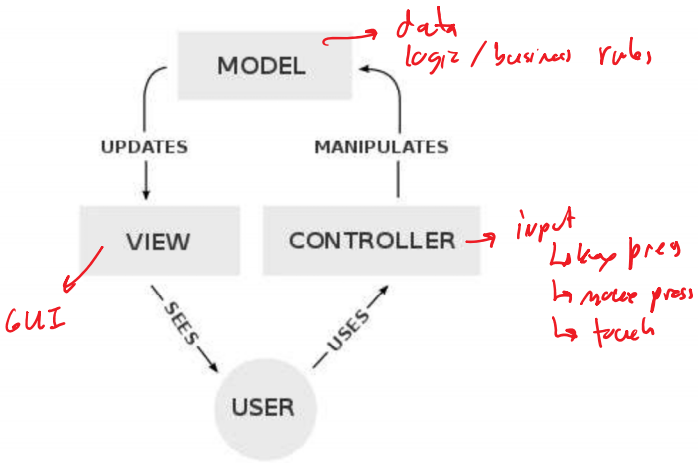
Lazy Initialization - Tactic of delaying the creation of an object, the calculation of a value, or some other expensive process until the first time it is needed.

Singleton - Ensure a class has only one instance, and provide a global point of access to it.

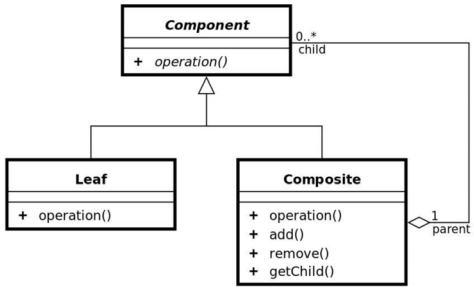
Observer or Publish/subscribe - Define a one-to-many dependency between objects where a state change in one object results in all its dependents being notified and updated automatically.



Model–view–controller - Commonly used for developing user interfaces that divide the related program logic into three interconnected elements (became popular for designing web applications)
https://en.wikipedia.org/wiki/Model%E2%80%93view%E2%80%93controller



Composite - Compose objects into tree structures to represent part-whole hierarchies. Composite lets clients treat individual objects and compositions of objects uniformly.



```
class Node<T> {
 T value;
 Node<T> next;
 public Node(T value, Node<T> next) {
  this.value = value;
  this.next = next;
 }
}
public class LList<E> implements List<E> {
 Node<E> front;
 int size;

 public LList() {
  this.front = new Node<E>(null, null);
 }

 public void prepend(E s) {
  this.front.next = new Node<E>(s, this.front.next);
  this.size += 1;
 }

 public void remove(int index) {
  Node<E> current = this.front;
  for(int i = 0; i < index; i += 1) {
   current = current.next;
  }
  current.next = current.next.next;
  this.size -= 1;
 }

 public void add(E s) {
  Node<E> current = this.front;
  while(current.next != null) {
   current = current.next;
  }
  current.next = new Node<E>(s, null);
  this.size += 1;
 }
}
```

private

```
private static ArrayList<Node<T>> pool = new ArrayList<>();
public static Node<T> createNode(T value, Node<T> next) {
    if (pool.size() > 0) {
        Node<T> node = pool.remove(0);
        node.value = value;
        node.next = next;
        return node;
    }
    return new Node<T>(value, next);
}
public static void removeNode(Node<T> node) {
    pool.add(node);
}
```

Node<E>?

```
Node.createNode(null, null);
```

```
Node.createNode(s, this.front.next);
```

```
Node.removeNode(current.next);
```

```
Node.createNode(s, null);
```

```
class SingleObject {
  private static SingleObject singleton;

  private
  public SingleObject() {
    //initialization
  }

  public static SingleObject get() {
    if (singleton == null) {
      singleton = new SingleObject();
    }
    return singleton;
  }
}
```

```
SingleObject obj = SingleObject.get();
```

```
interface SomeEvent {
  public void fire();
}
```

```
class SomeEventHandler implements SomeEvent {
  public void fire() {
    System.out.println("SomeEventHandler does some stuff").
  }
}
```

```
class OtherEventHandler implements SomeEvent {
  public void fire() {
    System.out.println("OtherEventHandler does some stuff").
  }
}
```

```
class Worker {
  List<SomeEvent> handlers;

  void listen(SomeEvent handler) {
    handlers.add(handler);
  }
  //void unlisten(SomeEvent handler) {}

  void actionHappened() {
    for (SomeEvent handler: handlers) {
      handler.fire();
    }
  }
}
```

```
void run() {
  if ( ) {
    actionHappened();
  }
}
```

```
SomeEvent evt1 = new SomeEventHandler();
SomeEvent evt2 = new OtherEventHandler();

Worker worker = new Worker();
worker.listen(evt1);
worker.listen(evt2);

worker.run();
```
