QuickSort: Another magical (recursive) algorithm
<https://www.youtube.com/watch?v=yv0B5GdG4>

14	4	9	12	15	8	19	2
----	---	---	----	----	---	----	---

Select a **pivot** element:

14	4	9	12	15	8	19	2
----	---	---	----	----	---	----	---

Partition the elements in the array (smaller or equal to pivot, larger or equal to pivot)

2	4	9	8	15	12	19	14
---	---	---	---	----	----	----	----

Magically sort the smaller elements and the larger elements (QuickSort)

2	4	8	9	12	15	19	21
---	---	---	---	----	----	----	----

Quick Sort: Using a "good" pivot

How many levels will there be if you choose a pivot that divides the list in half?

- A. 1
- B. $\log(n)$
- C. n
- D. $n \log(n)$
- E. n^2

If the time to partition on each level takes N comparisons, how long does QuickSort take with a good partition?

- A. $O(n)$
- B. $O(\log(n))$
- C. $O(n)$
- D. $O(n \log(n))$
- E. $O(n^2)$

- Which of these choices would be the worst choice for the pivot?
- A. The minimum element in the list
 - B. The last element in the list
 - C. The first element in the list
 - D. A random element in the list

best choice
→ median value

height
 $\log_2(n)$

Quick sort with a bad pivot

If the pivot always produces one empty partition and one with $n-1$ elements, there will be n levels, each of which requires $O(n)$ comparisons: $O(n^2)$ time complexity

Which of these choices is a better choice for the pivot?

- A. The first element in the list
- B. The last element in the list
- C. They are about the same

There are many ways to partition!

Quick sort - Middle pivot

- We always pick the middle location as pivot
- The data we sort is (2, 3, 1, 4, 6, 7)
- After the first split, what is the order of elements in the list and what are you?

- A. 1 2 3 4 6 7
- B. 2 3 1 4 6 7
- C. 4 3 2 1 6 7
- D. 3 4 1 2 6 7
- E. None of the above

10 4 3 7 2 5 9 4
3 2 9 4 10 0 7 8
3 2 4 8 7 9 10
5 2 9 8 19
3 2 9 7

sort (2, 4, 9, 3, 15, 8, 19, 2)

What is the first pivot?

How would you sort the data around the pivot?

low Index = low
high Index = high
pivot Index = (high - low) / 2 = (9 - 0) / 2 = 4

loop

if value [low Index] < pivot Value
low Index ++

else

swap (low Index, high Index)
high Index --

if value [high Index] < pivot Value
high Index --

else

swap (low Index, high Index)
low Index ++

if (low >= high)
done = true

low Index → 2 3 4 5 6

high Index → 6

12 4 9 3 15 8 19 2
2 4 3 15 19
3 15 19
15 19

← 1 →

split
or 0/1

Sorted array
1 2 3 4 5

$O(N)$

Reverse sorted
5 4 3 2 1

$O(N^2)$

1 swap
2 swap
3 swap

Swap?
change pivot value?

```
import java.util.Arrays;
public class Sort {
    static void selectionSort(int[] arr) {
        for (int i = 0; i < arr.length - 1; i++) {

    }
}
```

	Insertion	Selection	Merge	Quick
Best case time	Sorted array $\mathcal{O}(n)$	$\mathcal{O}(n^2)$	$\mathcal{O}(n + \log_2(n))$	Median value $\mathcal{O}(n + \log_2(n))$
Worst case time	Reverse sorted $\mathcal{O}(n^2)$	$\mathcal{O}(n^2)$	$\mathcal{O}(n + \log_2(n))$	$\mathcal{O}(n^2)$ Recursive case: $\mathcal{O}(n + \log(n))$
Key operations	swap(a, j, j+1) (swaps in the right place)	swap(a, i, indexOfMin) (after finding minimum value)	i = copy(a, 0, len/2) r = copy(a, len/2, len) a = sort(i) a = sort(r) merge(a, i, r)	p = partition(a, l, r) sort(a, l, p) sort(a, p+1, r)

Last note about sorting

Not only do we care about runtime, we also care about

- Space: do we need extra storage?
- Stable: if we have duplicates, do we maintain the same ordering?

Algorithm	Space	Stable
Bubble sort	$\mathcal{O}(1)$	Yes
Selection sort	$\mathcal{O}(1)$	No
Insertion sort	$\mathcal{O}(1)$	Yes
Heap sort	$\mathcal{O}(1)$	No
Merge sort	$\mathcal{O}(n)$	Yes
Quick sort	$\mathcal{O}(\log n)$	No

Key value
 $\mathcal{O}(\text{"q", "Merge"})$
 $\mathcal{O}(\text{"i", "Bubble"})$
 $\mathcal{O}(\text{"q", "Merge", "i", "Bubble"})$
 $\mathcal{O}(\text{"i", "Bubble", "q", "Merge"})$
 \rightarrow Unstable ordering

Java \rightarrow For ArrayList
 \rightarrow primitives \rightarrow Quick sort
 \rightarrow Object \rightarrow Merge sort
